Setting Up Cisco Jabber

Cisco Jabber is a software-based phone system that enables you to communicate remotely as if you were in the office. Don't have a COE computer that you can take home but need to communicate without giving up your private phone number? Use your city phone number from home and on the move making and receiving calls with Cisco Jabber!

Once Jabber is installed and configured all you need is a reliable internet connection to function.

We are also now making Cisco Jabber available for use on Android Mobile devices, Chromebooks and personal computers at home.

Sign up is easy — just reach out to your Telephony coordinator or Inside Information to request Jabber.

Include the following information:

- What kind of device will you be running your softphone on?
  - Windows
  - Android
  - Chromebook
- What is your desk phone number?

We will build a user profile for you and reach out with installation and setup instructions specific to you.

iOS is still in the works but should be coming later this summer.
