

Edmonton's Report on the Environment Calendar

The City of Edmonton is committed to environmental sustainability and effective environmental management through The Way We Green, Edmonton's Environmental Strategic Plan. The Plan was approved by City Council in 2011 and outlines principles, goals, objectives, policies and approaches to preserve and sustain our environment. The Way We Green is built on two main principles:

Sustainability: our society's ability to endure over a prolonged period as an integral part of Earth's natural systems and **Resilience:** the capacity of our city to withstand and bounce back from environmental disturbances.

The annual Edmonton's Report on the Environment communicates progress towards, or away from, those goals identified in our Environmental Strategic Plan. A significant aspect of environmental reporting is to make people aware of environmental data and present data in meaningful and engaging ways to reach as many people as possible. This Calendar is intended to provide a snapshot of the 7 environmental themes in our Annual Report, while at the same time showcasing some of the many extremely talented artists who call Edmonton home.

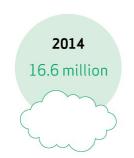

For more information, see our online dynamic report at edmonton.ca/GreenAnnualReport.

Energy and Climate Change

In 2014, Edmontonians used about 57,318 kWh equivalent of **energy** per person.

With the flick of a switch, the City of Edmonton is saving money and reducing environmental impacts. Over the next five years, the city intends to convert all 100,000 of its street lights to high efficiency LED bulbs, charting a greener path for citizens.

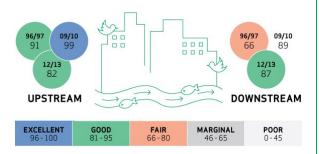

In 2014, Edmontonians produced 16.6 million tonnes of **carbon dioxide equivalent**.

A City of Edmonton sponsored study shows that Edmonton will not escape the effects of global warming. Climate change mitigation and adaptation measures need to be developed and implemented.

Water

In 2012/2013, the River Water Quality Index showed that the quality of water coming into Edmonton was Good and the downstream river water quality in the

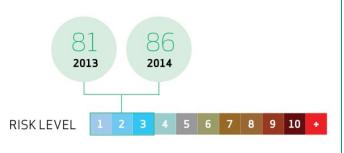

North Saskatchewan was also Good.

The index provides a simple snapshot of annual water quality conditions in major rivers of the province, such as the North Saskatchewan River.

Air

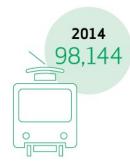

In 2014, 86% of days had an **Air Quality Health Risk** rating of Low.

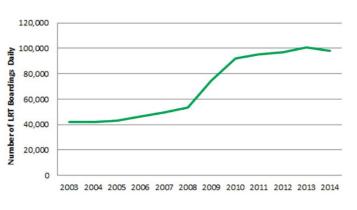

Airshed (ACA), one of nine airsheds in Alberta. The ACA has three main functions: air quality monitoring, managing air quality issues and air quality education.

Transportation

In 2014, there were approximately 98,144 LRT trips made daily. Over the past 10 years, LRT boardings have grown by 132.5%. The City of Edmonton aims to continue its expansion of the LRT network.

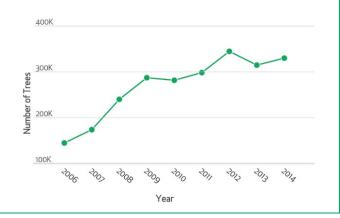

Nature & Biodiversity

In 2014, the City maintained 330,000 trees.

The shining green gem in Edmonton's cap is what we affectionately call our Urban Forest. To ensure its health and longevity, the Urban Forestry team conducts a Tree Health Assessment on half of these trees each year.

Waste

WE'VE ALL HEARD THE

dmonton.ca/GreenAnnualReport

In 2014, Edmontonians produced 282 kg of waste per person.

Actions such as composting and grasscycling can help reduce the amount of residential waste going to the landfill and help Edmonton advance towards zero waste.

Environmental Awareness Days

Statutory, Religious and Other **Noteworthy Days**

1st Quarter

O Full Moon

3rd Quarter

Sustainable Living and Food

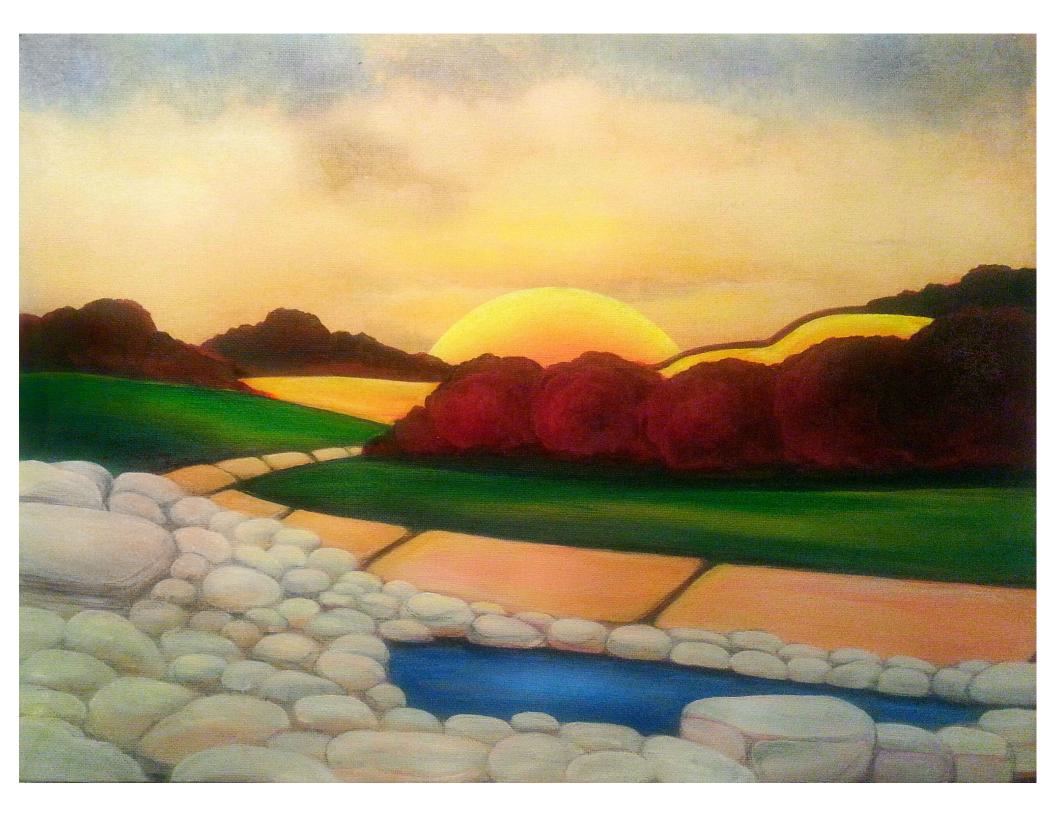

In 2014, there were 16 farmers markets in Edmonton from local producers.

The City of Edmonton was a-buzz, pilot testing an urban beekeeping project in 2014. As a

result of the pilot project, in April 2015, the Animal Licensing and Control Bylaw was officially changed to allow urban beekeeping within the City of Edmonton.

Did you know...?

More than 95% of Edmonton's energy comes from fossil fuels (such as coal, oil and natural gas) causing air quality, climate change and energy price risks to Edmontonians. Edmonton plans to generate more local renewable energy, such as solar energy. The number of homes and businesses installing solar energy systems is increasing as these systems become more affordable.

Fine particulate matter is a very small pollutant that impacts cardiac and respiratory health. On some days, Edmonton's fine particulate matter levels have exceeded air quality limits. There are many sources contributing to the problem, including vehicle emissions. There are actions we can all take to help improve our air quality such as reducing "warm-up" idling to 60 seconds before driving away, just enough time to make sure your vehicle's windows are clear.

Did you know...?

Domestic water use in Edmonton, on a per person basis, has historically been lower than the Canadian average due to a well established metering program, public education, rate setting methods and relatively short summers. However, the average person in Edmonton still used 194 litres of water per day in 2014, which could impact water availability in years of drought or with predicted climate change impacts. You can reduce your water use by actions such as installing high efficiency toilets and washing machines.

Residential infill is the development of new housing in established neighborhoods. Infill developments can help to create higher density, can present opportunities for affordable housing and contributes to social, environmental and fiscal sustainability. In 2014, 14% of new residential developments in Edmonton were infill.

A community garden is a growing space that a group of people have come together to nurture, develop and sustain. The key feature of a community garden in the Edmonton area is that any member of the public may join the community garden. Some community gardens in Edmonton are so popular that interested people have to put their names on a waitlist for a garden plot! Community gardens are one way to increase the sustainability and quality of life of our communities.

The relatively short lifespan of roads makes them one of society's most expensive infrastructure. Moving from single passenger vehicle commuting to more efficient transportation such as transit, cycling and walking lessens the stresses on roads and can also contribute to reducing greenhouse gas emissions.

Sustainable living is a way of life where we are able to meet our current needs while still making sure that these resources are available/replaceable for future users. Ecological footprint shows this concept. An ecological footprint equal to or less than 1.7 global hectares per person would represent sustainable living. In 2014, Edmonton's ecological footprint was 7.62 global hectares per person - NOT sustainable living.

Just like you can find EnerGuide ratings for your appliances, you can also find the EnerGuide rating for your house. So far, over 17,000 houses in Edmonton have a rating, meaning they had a home energy audit and now have information to help them choose which energy upgrades they would like to make to their home. Energy efficient homes save you money on your power bill and have environmental benefits as well.

Greenhouse gases absorb and trap heat, leading to climate change. This impacts us through extreme weather and flooding, increased temperatures and heat waves, drought and reduced water supplies and loss of biodiversity. In 2014, about 35% of Edmonton's greenhouse gas emissions were from transportation, 20% were from residential buildings, 24% were from industry sources and 21% were from commercial buildings.

Climate change due to an increase in greenhouse gas emissions impacts Edmontonians' long-term quality of life. City of Edmonton greenhouse gas (GHG) emissions measures the amount of GHG emissions from four main City operations sources: City buildings and facilities, streetlights, landfill waste degradation and the municipal fleet.
