| Residential Parking Zone    | To ensure that Victoria residents have access to on-street parking on their neighbourhood blocks. The cost for a Residential Parking Permit is estimated to be $20 per year. | This allows residents to park on-street regardless of the restrictions to other motorists; and to park in close proximity to their housing, particularly in neighbourhoods with congestion. | While residents can get permits based on need, in practice, Parking Services noted that very few permits are actually applied for and/or provided.  
Parking Services lack capacity for daily inspections. Rather, parking enforcement is based on complaints. | This program does not align with the majority of Policy Themes identified as it does not promote alternative modes of transportation, and does not provide equitable access to the program. | This program somewhat supports the Engagement Theme around provision of affordable and accessible parking spaces, however these spaces are only limited to permit holders. |
from citizens. Parking Services receives 20-30 complaints per day; and they inspect based on license plate and proof of residency.

City: Seattle, Washington (United States)
Population: 747,300 (2019 estimate)
Parking Context: Seattle reduced or eliminated parking requirements throughout the city, leading to fewer parking spaces (18,000) and cost savings of $537 million.
| Right-of-Way Prioritization | In 2016, the City of Seattle adopted a policy to define the curb lane as a “flex zone” allocating the curb to freight and passenger loading over metered parking along commercial corridors. Free long-term private vehicle storage is a low priority on key streets. “Seattle went through a process to identify the fundamental uses of the curb of flex zones, and to generally prioritize those uses in different zoning and land use settings.” (Estey, 2020) Illustration of uses of curb and prioritization, [here](#). | The **Flex Zone** policy ranks the following uses for curb based on whether the land use is for residential, commercial and mixed use, or industrial: modal plan priorities; access for commerce; access for people; public space activation; greening; and lastly, private vehicle storage. Residential areas rank “access for people” as top use for curb; Commercial and Mixed Use and Industrial areas rank “access for commerce” as top use for curb. This type of framework provides the City with an understanding of who/what the curb is best used for. The Flex Zone prioritization “gives us an opportunity to While the Flex Zone allows for “Different functions served at different times in the same space through time-of-day restrictions, such as a peak-period travel lane which is used for off-peak loading or parking,” (ite) one potential issue is monitoring and enforcement: “There are times when priorities conflict and there is limited right-of-way available for everyone. An example of how this plays out is when multiple modal plans identify the same street. Following the guidance, the modal plans take priority, but we recognize that people/goods loading has to occur somewhere for the buildings on those. | This program aligns with Policy Themes around strategic management of municipal assets; and support for business and the local economy by connecting people and places. This program aligns with Engagement Themes around efficient use of the transportation system, improved accessibility, affordability, and design of parking spaces; as well as enabling mode-shift from automobile usage. |
| Demand-Based Pricing | In Seattle, data on parking occupancy is collected annually for each of the city’s 30 paid parking areas. Rates are adjusted up or down in line with occupancy targets and other performance metrics. The purpose is to adjust the cost of permits so that curbside use does not exceed supply. Seattle’s Performance-Based Parking Pricing | “Ensures permit value as curbside space will reasonably be available. More reflective of value for curbside commodity.” (NACTO, 2017) | “May be cost prohibitive to lower income households and may limit their mobility options. Challenges in determining appropriate price point.” (NACTO, 2017) | This program aligns with Policy Themes around strategic management of municipal assets; adaptability to accommodate/support emerging technologies; and support for business and the local economy by connecting people and places. | This program aligns with Engagement Themes around improving the accessibility, affordability, and design of parking spaces, as well as supporting mode-shift away from automobile usage by pricing parking spaces appropriately.
Program has been in place since 2011. Its foundation is in the Seattle Municipal Code, which says Seattle should use data to adjust rates so that there are one to two available spaces per block throughout the day. Seattle has 30 paid parking areas, each with morning, mid-day and evening rates.

Seattle collects parking occupancy data and uses that data to adjust rates up or down for areas/times outside our target 70 – 85% occupancy. Their rates vary between $0.50/hour and $5.00/hour. Much more information on this program can be found in a variety of places, including here and here. Our most recent annual parking study report can be found here.

| Restricted Parking Zones (RPZs) | Restricted Parking Zone (RPZ) Program was created in 1979 to help ease parking congestion in residential neighborhoods surrounded by major traffic generators like hospitals and universities, while balancing the needs of all people to be | Seattle's RPZs help neighborhoods deal with the impacts from major traffic generators through transportation and parking demand management strategies and signed time limits from which vehicles displaying a valid RPZ permit are Exempt. | Pricing for permits is $65/two years, which may lock residents into unused permits if they decide to move. “Our desire over the past couple years has been to move towards a system more akin to our Performance-Based Parking Pricing | This program does not align with the majority of Policy Themes identified as it does not promote alternative modes of transportation, and does not provide equitable access to the program | This program somewhat supports the Engagement Theme around provision of affordable and accessible parking spaces, however these spaces are only limited to permit holders. |
able to use the public streets.

Outreach was conducted with 1,100 respondents to assess the RPZ program.

program, recognizing there are different demands for RPZ permits in different neighborhoods. You can find more information on that effort [here](#). We've had to put that effort on the shelf for the time-being.” (Estey, 2020)
